

# Reaching a Decision to Apply

Workshop on Analysis of Alternatives and Socio-Economic Impacts  
in Applications for Authorisation

2-3 October 2012

ECHA - Helsinki

*Hsieng-Ye Chang*  
Authorisation/Restriction Platform, Cefic

## **Some Considerations for Deciding Whether to Apply for Authorisation**

---

- **Do your business leaders and decision-makers understand the impact of authorisation, whether it is to continue use or to phase-out?**
- **What are your “potential” alternatives?**
- **Do you know the properties required to achieve the same technical function?**
- **What is your long-term business outlook if you continue to use the substance?**
- **If you “have” alternatives, can you phase out in 3 years, as a conservative estimate, from the time substance is placed on the Candidate List?**
- **What is your customer saying about SVHCs?**
- **Do your customers have alternatives available to them?**
- **What is your company’s R&D budget and long-term plan?**

# Business and Economic Factors

Consideration	Remarks
Operate as usual and stop use by sunset date	<ul style="list-style-type: none"> <li>• Feasible only for “non-strategic business”</li> </ul>
Shut down manufacturing facility in the EU	<ul style="list-style-type: none"> <li>• Loss of jobs locally</li> <li>• Disruption of supply to EU downstream users</li> <li>• Loss of innovation in the EU, especially if affected products are used in the areas of energy saving solutions, safety and protection of humans, etc.</li> </ul>
Increase R&D to stop use of substance	<ul style="list-style-type: none"> <li>• No guaranteed result</li> <li>• May not be possible if substance is used in majority of portfolio of products you sell → option, close business</li> <li>• Reality: during economic hardship, R&amp;D resources may be reduced</li> <li>• Uncertainty of future market may be a disincentive to innovate</li> </ul>
Ensure continued supply	<ul style="list-style-type: none"> <li>• For formulators and articles producers, supplier has not confirmed they intend to apply for authorisation of your use</li> <li>• Allows for greater flexibility to choose between suppliers</li> </ul>

# Business and Economic Factors

Consideration	Remarks
Plans to reduce use of substance and its presence in products	<ul style="list-style-type: none"><li>• An option if no alternative substance or technology has been identified</li></ul>
Likelihood of obtaining authorisation	<ul style="list-style-type: none"><li>• Have communicated internally to business managers and decision makers on impact of authorisation and different options available</li><li>• May have already identified available resources - both financial and expertise required - to prepare authorisation application</li><li>• Possibility of joint application to share costs, but need to be wary of competition law issues</li><li>• May already have information to show that health risks are adequately controlled or able to show <u>little to no exposure</u> throughout life-cycle of use of the substance.</li></ul>
Other uncertainties leading to decision to apply	<ul style="list-style-type: none"><li>• Cannot keep substituting if health concern criteria keep changing</li><li>• Difference in RMO of alternatives with similar toxicity profile creates uncertainty in available alternatives and raises question of preference of one SVHC over another → “wait and see” approach</li></ul>

# Alternatives: A major factor

Consideration	Remarks
Gather available information on potential alternative substances	<ul style="list-style-type: none"><li>• May already be known before decision to apply</li></ul>
Identify substance properties that are important for:	<ul style="list-style-type: none"><li>• Technical processing (e.g., does not destroy the raw material during formulation)</li><li>• Function of the product (e.g., product sold downstream retains the same desired properties)</li></ul>
Special applications typically have a narrow range of alternatives	<ul style="list-style-type: none"><li>• May have similar toxicity profile to substance where substitution is sought</li></ul>
Alternatives <u>do not</u> always provide the same (or better) technical function	<ul style="list-style-type: none"><li>• Especially important for applications where safety is a primary concern (e.g., automobile and aerospace industries)</li></ul>
Alternatives may be available	<ul style="list-style-type: none"><li>• But may not always be able to phase-out before application deadline and/or sunset date</li></ul>
Alternate way of processing (“technical alternatives”)	<ul style="list-style-type: none"><li>• Takes years of R&amp;D efforts with no guaranteed result</li></ul>

## Alternatives: A major factor

Solvent	Property 1	Property 2	Property 3	Commercial availability	Toxicity
Substance A	Good	Good	Good	Good	CMR
Alternative 1	Good	Good	Bad	Good	CMR
Alternative 2	Bad	Good	Bad	Good	CMR
Alternative 3	Bad	Bad	Bad	Limited	Unknown
Alternative X	Maybe	Good	Good	Good	Unknown

For example, would require significant increased use of energy → greater environmental impact

- Does not provide desired result during processing
- End product does not have the same technical function

- Uncertainty in available supply
- Limited data available → potential concerns on substance properties

Toxicity not well studied, but based on similar chemical properties to Substance A, not unreasonable to conclude it is a CMR

# Downstream User (Customer) Reactions

Consideration	Remarks
<p>Don't want any SVHCs!</p>	<ul style="list-style-type: none"> <li>• Proactive communication by supplier on long-term plans and actual potential health risks versus perception (i.e., risk communication)</li> <li>• For some uses, amount of substance remaining further down the supply chain is very low, and there is no or little exposure and release to the environment</li> </ul>
<ul style="list-style-type: none"> <li>• Disruption of supply</li> <li>• No alternatives for the downstream user</li> </ul>	<ul style="list-style-type: none"> <li>• Some industry sectors have lengthy recertification and requalification process required by law (e.g., air worthiness, product safety, quality assurance programs)</li> <li>• Some products may have thousands of components → potentially perpetual process of recertification/requalification</li> <li>• Even for minor changes (e.g., reduction in SVHC content), may still need to go through lengthy process → increased cost of doing business and need to stay competitive</li> <li>• Alternative material needs to be evaluated against real-life simulations (e.g., change in brake components in cars, electrical transformers, aircraft engines)</li> <li>• No alternatives that provide the same technical functionality</li> </ul> <p>→ Wants reassurance that supplier intends to apply for authorisation</p>

# Other Considerations

Consideration	Remarks
Multiple uses	<ul style="list-style-type: none"><li>• Which use(s) to apply for?</li></ul>
Joint application	<ul style="list-style-type: none"><li>• What if other potential applicants have different assessment of the situation?</li></ul>
Company's internal structure	<ul style="list-style-type: none"><li>• Need to ensure internal alignment → more time may be needed to gather information and come to an agreement on path-forward</li></ul>
Unique application	<ul style="list-style-type: none"><li>• Submit application separately to avoid having to share information on a “niche” use</li></ul>
Foreign manufacturer	<ul style="list-style-type: none"><li>• Whether to apply for authorisation on behalf of your EU customers</li></ul>
Balancing perception vs. actual risks	<ul style="list-style-type: none"><li>• May be difficult for some business decision-makers to understand regulatory actions taken for an application that has been in use for decades with stringent RMMs and no reported incidents</li></ul>
Estimated time-line	<ul style="list-style-type: none"><li>• Need to provide business decision-makers with estimated time-line and resources needed for preparing an authorisation application</li></ul>

## Facts about Authorisation

---

- **In coming to a decision to apply, find that authorisation:**
  - **Is complex and resource intensive**
  - **Creates a lot of uncertainty about the future market which can impact innovation in the EU**
  - **Increases cost of doing business, potentially resulting in losing competitive edge against outside competitors**
- **Other RMOs may be more efficient in ensuring protection of human health and the environment**

---

**TIME PERMITTING**

**Backup Slides of Example Cases**

**OTHERWISE,  
THANK YOU FOR YOUR ATTENTION!**

# Example Company A

- **Substance A in use for 50+ years, known toxicity**
- **Available in-house information:**
  - No known viable alternatives, other similar solvents all have similar toxicity profile
  - Final Product has strong socioeconomic benefits
  - No other competitor products perform with the same functionality
- **Use**
  - Solvent during processing and ends up as an impurity at residual level with no technical function
  - Impurity in article cannot be easily removed, but could be reduced
  - No consumer use of article
  - Occupational exposure well-controlled due to known CMR property
- **Began market analysis to gauge customer reaction when Substance A proposed for inclusion to the Candidate List. Customer concerns:**
  - Product no longer available long term
  - What are the risks to human health or the environment?
  - “Don’t want to have any SVHC content!”
- **Approval from business managers and decision-makers to set aside resources to apply for authorisation**
- **Decision to apply:**
  - Immediately when substance placed on the Candidate List
  - Otherwise, option was to shut down the facility in the EU

**These examples are not reflective of all scenarios, but provided as examples only!**

## Example Company B

---

- Substance X used in niche market, known toxicity
- Majority of Company B's formulated products contain Substance X
- Not possible to phase-out:
  - No alternatives to provide same functionality for downstream users in niche market
  - Customer indicated desire to continue use of Substance X products, recognizing they may potentially be banned → no currently suitable alternatives that provide the same technical function required
  - Customer has long requalification process

### Decision to apply:

- Made even before Substance X was placed on the Candidate List
- Major reason: no alternative and majority of formulated products contain Substance X used in niche market

**These examples are not reflective of all scenarios, but provided as examples only!**
